Web Developer & Automation Support

Remote, project-based | [Website](#) | [Portfolio](#) | [GitHub](#) | dynascapes@gmail.com

Professional Summary

Web developer focused on practical small-business sites, frontend cleanup, forms, dashboards, API workflow support, documentation, and launch QA. I work best on scoped paid trials, bug fixes, small builds, and async project work where the requirements and payment method are clear.

Core Skills

Frontend: HTML, CSS, JavaScript, responsive layouts, static sites, GitHub Pages.

Web app support: React-style component work, UI cleanup, forms, dashboards, deployment checks.

Backend/API support: Node.js workflow support, API planning, integration notes, data flow mapping.

Delivery: QA checklists, readable docs, milestone notes, launch fixes, handoff summaries.

Business web: Service pages, pricing/contact sections, policy pages, Stripe-ready payment copy.

Project Experience

Shadow AI Studio service site

Built and maintained a responsive public service site for web and automation work, including service packages, contact flow, privacy/refund/terms pages, and Stripe-ready payment language.

Portfolio page

Created a client-shareable portfolio page with project summaries, service capabilities, boundaries, and direct links that can be sent during Discord or freelance outreach.

Launch audit and fix workflow

Built a repeatable workflow for checking small sites and prototypes: find launch blockers, group issues by severity, fix high-impact problems, and document remaining work plainly.

Automation workflow planning

Designed service packages for turning repetitive admin or content tasks into documented steps, implementation notes, error handling, and simple handoff docs.

Good-Fit Work

Small web fixes, landing pages, GitHub Pages deploys, dashboard cleanup, forms/contact flows, documentation, API/integration planning, scoped automation workflows, and paid trial tasks.

Work Boundaries

No account farming, fake engagement, KYC/identity work, private credential handling, risky downloads, or unpaid tests that produce usable client deliverables.
